Workshop Overview

A practitioner workshop, not a product overview. Hands-on, self-paced coverage of the complete IFP 2.1 delivery workflow — Application Framework configuration, model generation, error log resolution, and building customer-specific extensions from scratch.

If you've ever generated an IFP model, hit an error log, and weren't sure whether to escalate or fix it yourself — this workshop closes that gap. Every exercise uses real planning scenarios: OpEx/Headcount, Insurance 3-Statement, and Nuclear Plant OpEx.

Objectives & Outcomes

- Configure the Application Framework end-to-end and generate a functional IFP model
- Triage generation error logs without escalating basics
- Build production-grade extensions: direct input + headcount × rate
- Apply Configure-vs-Extend-vs-Modify discipline (Anaplan Way for Applications)

Prerequisites

MB, SA, or Master Anaplaner certification
· Prior Anaplan model-building experience ·
Financial planning literacy (P&L; balance sheet, headcount).

Format & Pace

Self-paced

1-2 hours per day on your own schedule, in any order. **Dedicated training tenant for the week of your registered session** — pre-staged with IFP models, refreshed over the weekend, no extensions. Plan to start on day 1 of your week.

Exercises

EXERCISE: APPLICATION FRAMEWORK

Configurator — end-to-end

All 44 Application Framework questions: entities, currency, dimensionality, max-level rules, generation. No answer key; verifies against the post-generation checklist.

Hands-On · Core

EXERCISE: DIRECT INPUT EXTENSION

Direct Input with two adjustment layers

Production-grade Direct Input for OpEx + Headcount — drivers, period locks, audit trails, end-to-end flow through ADO into the P&L; Data-tagged for version upgrades.

Hands-On · Extensions

EXERCISE: HEADCOUNT × RATE METHOD

Rate-based headcount planning extension

Extend Headcount with rate cards — grade-to-rate mapping, period-by-period comp, validation without touching core. Practice Extend-vs-Modify + data tagging.

Hands-On · Extensions

EXERCISE: ERROR LOG TRIAGE

Read, categorize, resolve generation errors

Realistic generation error logs from production-style mistakes. Common formula + dependency errors, the fix-regenerate-verify loop. Resolve independently instead of escalating basics.
